

Fig. 1

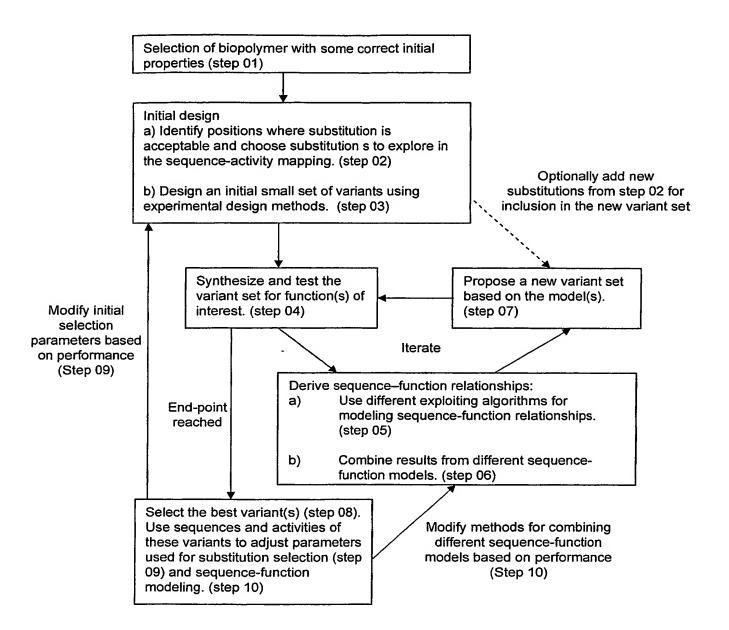

Figure 2

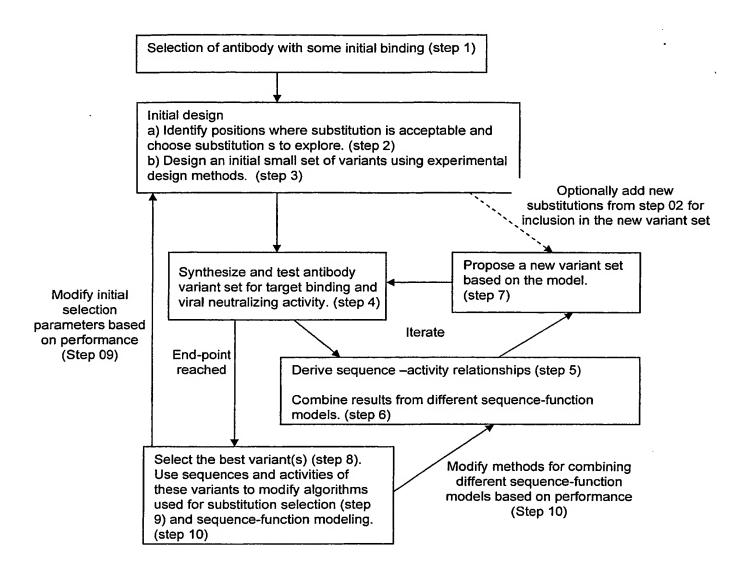

Figure 3

Identify all sequences homologous to starting enzyme and align (eg using ClustalW)

# A: Substitutions from homologous sequences

Reconstruct phylogenetic tree

### RULE 1a:

- Calculate conservation index for each position
- · Select substitution sites with lowest conservation indices

#### RULE 2a

- · Calculate tolerated heterogeneity for each position
- Select most heterogeneous substitution sites

### RULE 3a:

- Calculate relative rates of synonymous and non-synonymous substitution
- · Select sites with highest ratios

## SCORE:

Weighted value for each rule satisfied

# **B:** Substitutions from homologous structures

### RULE 1b:

- Calculate ΔG change for all single substitutions
- Select changes with <a defined value Kcal/mol change in free energy RULE 2b:
- Superpose homologous structures from PDB
- Estimate mean RMSD for every window of a defined number of residues
- Select sites with a RMSD above a defined value

## RULE 3b:

- · Identify changes found in homologous sequences
- Select varying sites within a defined distance of catalytic and binding sites
   SCORE:
- · Weighted value for each rule satisfied

### C: Substitutions from substitution matrices

#### RULE 1c:

- Calculate substitution matrix for specific biopolymer family, rank all possible single substitutions for favorability
- · Select highest scoring positions

## RULE 2c:

- Rank all possible single substitutions for favorability using a universal substitution matrix
- Select highest scoring positions

#### SCORE:

· Weighted value for each rule satisfied

## D: Substitutions from PCA analysis

#### RULE 1d:

- Determine principal components of sequence variation in alignment of homologs
- Select highest scoring positions

## SCORE:

· Weighted value for each rule satisfied

## Select initial candidate antibody sequence(s)

# A: Substitutions from homologous sequences in framework & CDR

Identify framework sequences within a defined evolutionary distance (PAM units)

Reconstruct phylogenetic tree for framework region only

RULE 1a:

Select a defined number of framework residues that have undergone advantageous change

RULE 2a:

 Select defined number of framework and defined number of CDR positions with highest mutability index

RULE 3a:

 Select <u>all</u> amino acid substitutions from sequences in the same Chothia class SCORE:: Weighted value for each rule satisfied

## B: Substitutions from homologous structures

Superpose homologous structures from PDB

RULE 1b:

- Estimate mean RMSD for every window of a defined number of residues
- Select framework sites with an RMSD greater than a defined value RULE 2b;
- · Identify changes found in homologous sequences
- Select framework varying sites within a defined distance from CDR

SCORE:: Weighted value for each rule satisfied

# C: Substitutions from substitution matrices

 Calculate substitution matrix for all framework regions and canonical classes, rank all possible single substitutions for favorability

RULE 1c:

Select highest scoring substitutions for each matrix

RULE 2c:

- Rank all possible single substitutions for favorability using a universal substitution matrix
- Select highest scoring positions

SCORE: Weighted value for each rule satisfied

### D: Substitutions from PCA analysis

- Determine principal components of sequence variation in alignment of homologs RULE 1d:
- Group CDRs based on PCA of amino acid sequences in the CDR.
- Select highest scoring CDR positions that differentiate antibody sequences by function RULE 2d:
- Group CDR positions based on observed amino acid frequencies at each site
- Rank the groups based on contributions to one or more principal components
- Select the top groups of sites to vary.

SCORE: Weighted value for each rule satisfied

# E: Substitutions from Binding pocket Analysis

RULE 1e:

 Select sites based where physico-chemical properties of residues are conserved in the pocket

RULE 2e:

 Select CDR changes derived from evolutionary models to correlate properties of amino acids.

SCORE: Weighted value for each rule satisfied

- A: Calculate average weight vectors:
- a) Build sequence-function model from data in which rows (sequence + function) and/or columns (substitutions) are randomly omitted. Calculate weight vectors.
- b) Repeat 1,000 times.
- c) Calculate average values and standard deviations for weight vectors and rank in order of importance.

# Figure 6

- A: Calculate average weight vectors:
- a) Build sequence-function model from data in which rows (sequence + function) and/or columns (substitutions) are randomly omitted. Calculate weight vectors.
- b) Repeat 1,000 times.
- c) Calculate average values and standard deviations for weight vectors and rank in order of importance.

- B: Calculate weight vectors from randomized data:
- a) Randomly associate sequence data with function data
- b)Build sequence-function model and calculate weight vectors.
- c) Repeat 1,000 times.
- d) Calculate average value and standard deviations for weight vectors from randomized data.

C: Calculate number of standard deviations weight vector is above value from randomized data.

Figure 25

Identify all sequences homologous to MX PEP and align using ClustalW A: Substitutions set RULE 1a: Identify all substitutions seen in 35 homologs from Genbamk Consider only these susbtitutions (ie RULE 1a is a filter) B: Substitutions from homologous sequences · Reconstruct phylogenetic tree RULE 1b: Calculate evolutionary proximity of the closest homolog in which each substitution occurs (EP) RULE 2b: Calculate site heterogeneity at each substitution position (SH) RULE 3b: Calculate entropy at each substitution position (SE) Calculate number of times a substitution is seen at a position in the set of homologs (SN) C: Substitutions from substitution matrices RULE 1c: Calculate favorability of each substitution using a PAM250 matrix (SM).

Figure 26

Score =  $f(EP) \times f(SH) \times f(SE) \times f(SN) \times f(SM)$ 

Align heavy chain sequences from Genbank accession # AAF21612 with human germline immunoglobulin heavy chain sequences from VBase using ClustalW.

### A: Substitutions set

### RULE 1a:

- Enumerate and classify the substitutions into 2 categories.
- (i) Substitutions found in the framework region (FW) and
- (ii) substitutions found in the complementarity determining region (CDR).
- Consider only these susbtitutions (ie RULE 1a is a filter), and consider them separately

## B: Substitutions from human germline sequences

Reconstruct phylogenetic tree

## RULE 1b:

 Calculate evolutionary proximity of the closest homolog in which each substitution occurs (EP)

## RULE 2b:

- Calculate site heterogeneity at each substitution position (SH)
- RULE 3b:
- Calculate entropy at each substitution position (SE)

### RULE 4b:

 Calculate number of times a substitution is seen at a position in the set of homologs (SN)

# C: Substitutions from substitution matrices

## RULE 1c:

Calculate favorability of each substitution using a PAM100 matrix (SM).

## D: Score

 $Score_{FW} = f(EP) \times f(SH) \times f(SE) \times f(SN) \times f(SM)$ 

 $Score_{CDR} = f'(SE) \times f'(SN) \times f'(SM)$ 

Figure 27

Align RSV-19 heavy chain sequence with human germline ig heavy chain sequences from VBase using ClustalW.

### A: Substitutions set

### RULE 1a:

- Enumerate and classify the substitutions into 2 categories.
- · (i) Substitutions found in the framework region (FW) and
- · (ii) substitutions found in the complementarity determining region (CDR).
- Consider only these susbtitutions (ie RULE 1a is a filter), and consider them separately

# B: Substitutions from human germline sequences

Reconstruct phylogenetic tree

## RULE 1b:

 Calculate evolutionary proximity of the closest homolog in which each substitution occurs (EP)

### RULE 2b:

- Calculate site heterogeneity at each substitution position (SH) RULE 3b:
- Calculate entropy at each substitution position (SE)

### RULE 4b:

 Calculate number of times a substitution is seen at a position in the set of homologs (SN)

## C: Substitutions from substitution matrices

### RULE 1c:

Calculate favorability of each substitution using a PAM100 matrix (SM).

## D: Score

 $Score_{FW} = f(EP) \times f(SH) \times f(SE) \times f(SN) \times f(SM)$ 

 $Score_{CDR} = f(SE) \times f(SN) \times f(SM)$
